ESTRUCTURA: ICA SEDE MAGANGUÉ

1. PRESENTACIÓN

Se procede a llevar a cabo una serie de acciones tendientes a determinar el estado actual de la cubierta perteneciente al ICA - SEDE MAGANGUÉ en el departamento de Bolivar

La realización de este estudio técnico se desarrolló el día 29 de Noviembre de 2024, con el propósito de obtener un análisis detallado que permita identificar si la estructura de cubierta presenta algún deterioro o afectación estructural que comprometa su estabilidad.

Este proceso de reconocimiento técnico se realiza, empleando tecnologías avanzadas y metodologías especializadas mediante ensayos no destructivos para evaluar tanto la apariencia superficial como los posibles problemas estructurales subyacentes que podrían comprometer la seguridad y el bienestar de los ocupantes de la estructura. Cabe destacar que esta visita técnica constituye la primera fase de un estudio integral que abordará de manera sistemática y detallada todos los aspectos relacionados con la patología como insumo para el análisis numérico estructural de la estructura, sentando así las bases para un análisis técnico completo que se llevará a cabo en las etapas subsiguientes de este estudio.

2. OBJETIVO.

El objetivo principal de este Estudio patológico es el determinar las características mecánicas y y el estado actual en el que se encuentra la estructura llevando a cabo ensayos no destructivos que permitan llegar a un diagnóstico certero, con el propósito fundamental de determinar, de manera integral, el grado de afectación y las recomendaciones de intervención necesarias para la rehabilitación a través de métodos especializados de evaluación y tecnologías avanzadas, se busca identificar cualquier tipo de deterioro, daño o amenaza potencial que pueda afectar la seguridad, estabilidad y adecuado funcionamiento de la cubierta.

3. LOCALIZACIÓN.

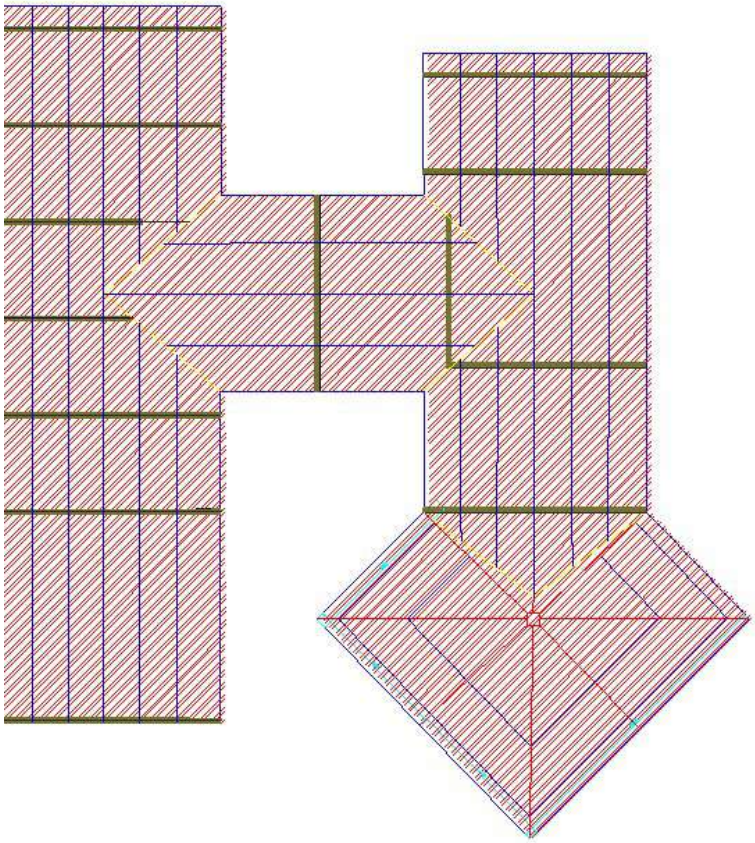
La estructura se encuentra localizada en MAGANGUÉ en el departamento de Bolivar, posee un frente de 27.12 metros por 21.21 metros de profundidad para un área en planta de 1054.7 m2.

Ilustración 1. Imagen de la Ubicación del Proyecto. Fuente: Google Earth.

4. DESCRIPCIÓN GENERAL DEL LA CUBIERTA EN ESTUDIO.

La cubierta se compone de un sistema combinado de cerchas apoyadas sobre culatas de viguetas de concreto de 0.20*.30 m que se encuentran sobre los muros portantes de la estructura, este entramado de cubierta se compone de3 tipologias de cerchas compuestas con perfiles de angulos de lados iguales y tensores de aceros.

El estudio se centra según su alcance en la cubierta metálica perteneciente al Instituto Colombiano Agropecuariola cual corresponde a un area aproximada de 409.50 m2.



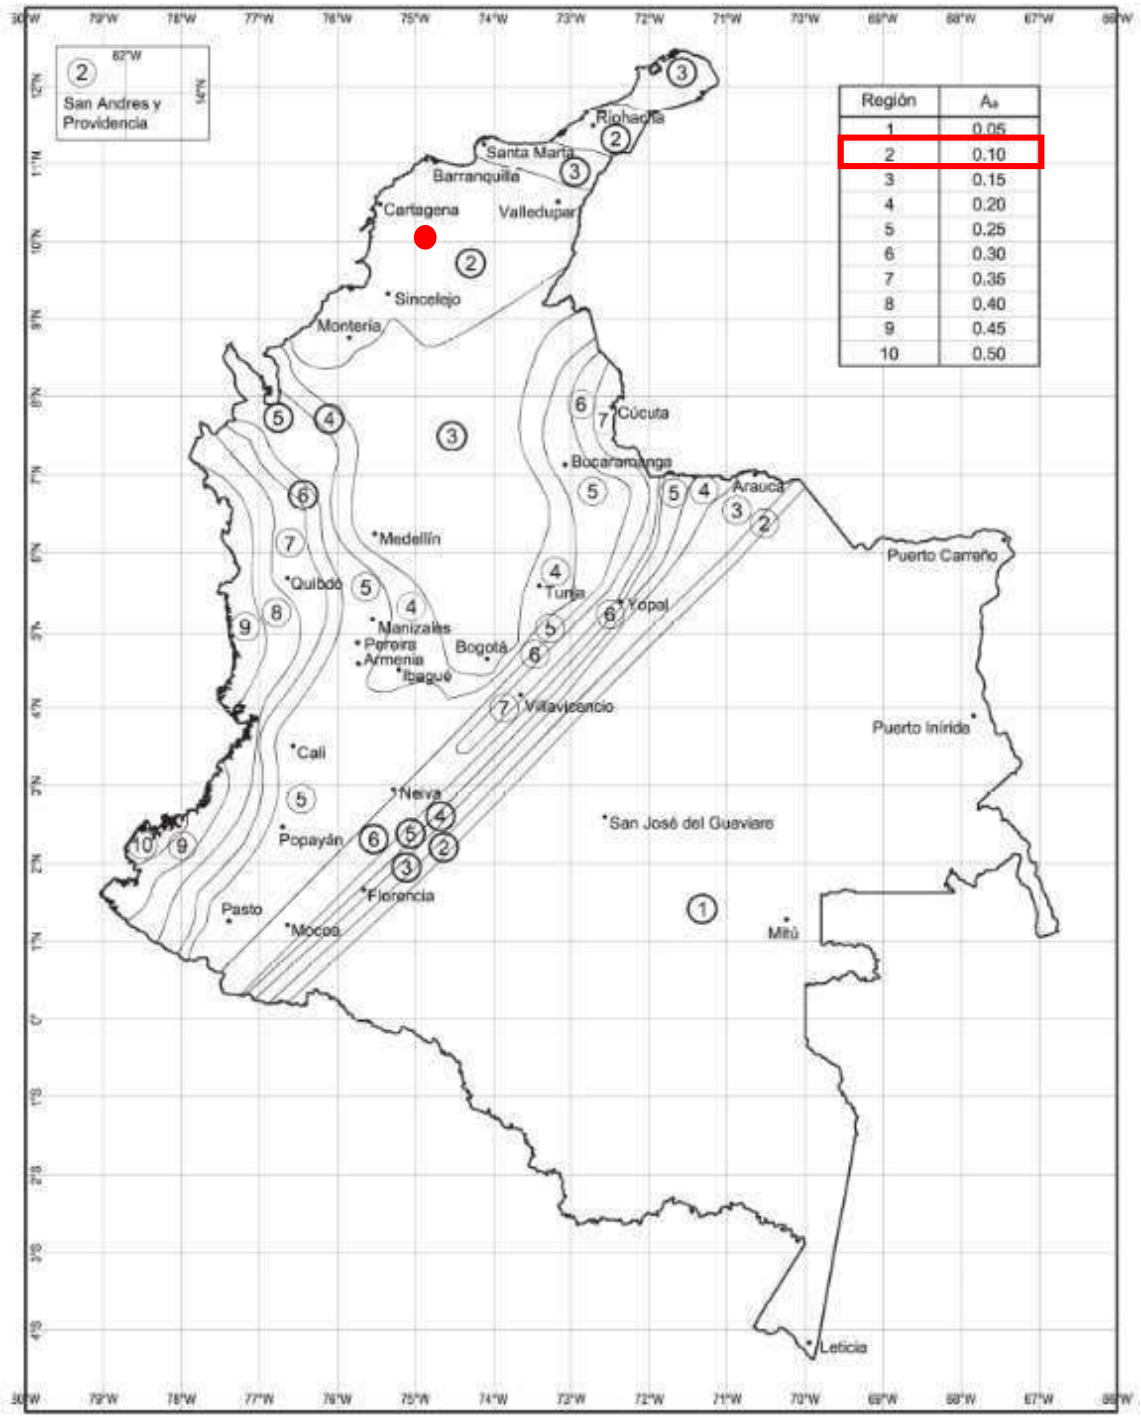


Ilustración 2.Alcance de la auscultación. Fuente: Modelación.

5. ZONA DE RESPUESTA SÍSMICA Y GEOLOGÍA

Según el capítulo A.2 – Zonas de Amenaza Sísmica y Movimientos Sísmicos de Diseño del Reglamento Colombiano de Construcción Sismo Resistente (NSR-10), se presenta los coeficientes de la aceleración horizontal pico efectiva (Aa) y velocidad pico efectiva (Av).

6. ANALISIS DE CONDICIONES DEL ENTORNO Y CLIMATOLOGIA

Es necesario conocer las variables y fuentes de ataques que pueden afectar la durabilidad de la estructura por ello se hace un recuento de la condiciones climáticas a tener en cuenta

6.1. CLIMA.

La temporada calurosa dura 2,6 meses, del 24 de enero al 13 de abril, y la temperatura máxima promedio diaria es más de 35 °C. El mes más cálido del año en El Carmen de Bolívar es abril, con una temperatura máxima promedio de 34 °C y mínima de 24 °C.

La temporada fresca dura 2,4 meses, del 16 de septiembre al 28 de noviembre, y la temperatura máxima promedio diaria es menos de 32 °C. El mes más frío del año en El Carmen de Bolívar es noviembre, con una temperatura mínima promedio de 23 °C y máxima de 32 °C.

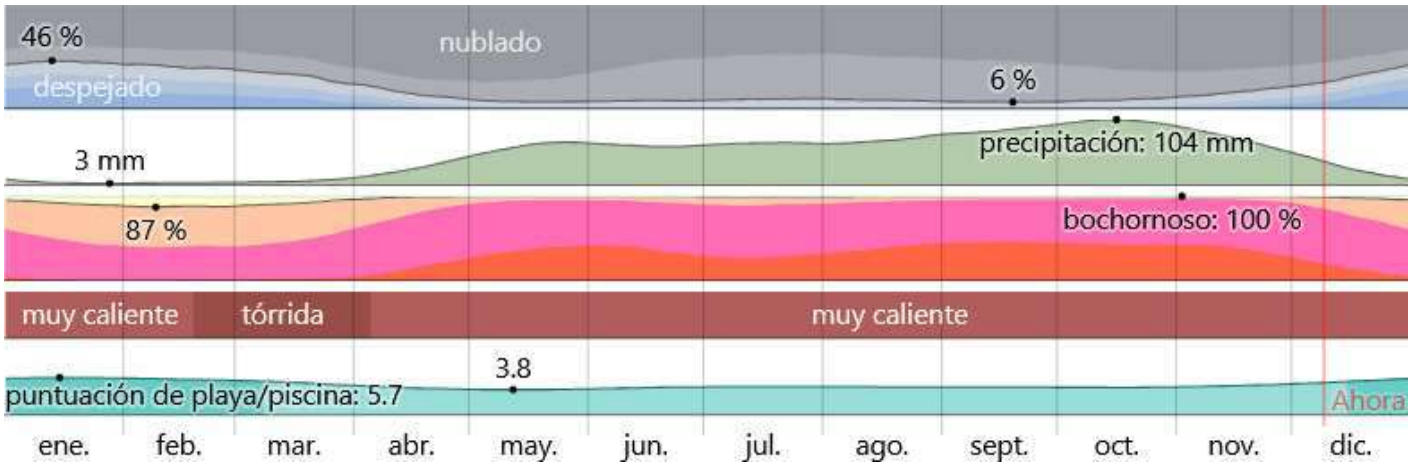

Ilustración 6. Consulta clima en Bogotá D.C. -.(Fuente Weatherspark).

La temporada templada dura 3,2 meses, del 20 de diciembre al 26 de marzo, y la temperatura máxima promedio diaria es más de 19 °C. El mes más cálido del año en Bogotá es abril, con una temperatura máxima promedio de 18 °C y mínima de 9 °C.

La temporada fresca dura 2,2 meses, del 20 de junio al 27 de agosto, y la temperatura máxima promedio diaria es menos de 18 °C. El mes más frío del año en Bogotá es enero, con una temperatura mínima promedio de 7 °C y máxima de 19 °C.

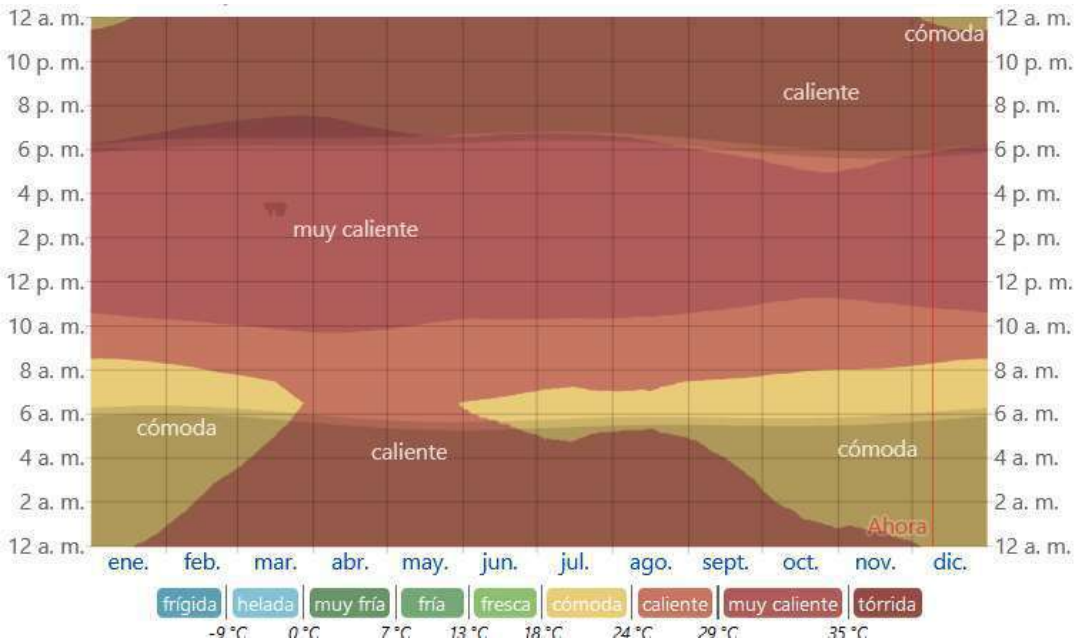

Ilustración 7. Consulta temperatura máxima mínima y promedio. (Fuente Weatherspark).

6.2. HUMEDAD Y PRECIPITACIONES

Uno de los componentes que pueden afectar la sanidad de los materiales constitutivos de una construcción es el vapor de agua la cual tiene una relación estrecha con la componente en la estabilidad atmosférica de precipitaciones, Un día mojado es un día con por lo menos 1 milímetro de líquido o precipitación equivalente a líquido. La probabilidad de días mojados en El Carmen de Bolívar varía considerablemente durante el año.

La temporada más mojada dura 7,0 meses, de 29 de abril a 29 de noviembre, con una probabilidad de más del 23 % de que cierto día será un día mojado. El mes con más días mojados en El Carmen de Bolívar es octubre, con un promedio de 13,1 días con por lo menos 1 milímetro de precipitación.

La temporada más seca dura 5,0 meses, del 29 de noviembre al 29 de abril. El mes con menos días mojados en El Carmen de Bolívar es febrero, con un promedio de 0,8 días con por lo menos 1 milímetro de precipitación.

Entre los días mojados, distinguimos entre los que tienen solamente lluvia, solamente nieve o una combinación de las dos. El mes con más días con solo lluvia en El Carmen de Bolívar es octubre, con un promedio de 13,1 días. En base a esta categorización, el tipo más común de precipitación durante el año es solo lluvia, con una probabilidad máxima del 44 % el 21 de octubre.

En El Carmen de Bolívar la humedad percibida varía levemente.

El período más húmedo del año dura 10 meses, del 10 de marzo al 21 de enero, y durante ese tiempo el nivel de comodidad es bochornoso, opresivo o insoportable por lo menos durante el 90 % del tiempo. El mes con más días bochornosos en El Carmen de Bolívar es octubre, con 31,0 días bochornosos o peor.

El mes con menos días bochornosos en El Carmen de Bolívar es febrero, con 25,4 días bochornosos o peor.

Ilustración 8. Consulta precipitaciones diarias. (Fuente Weatherspark)

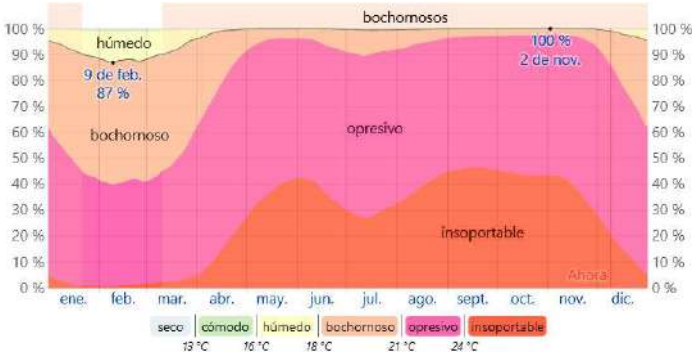

Ilustración 9. Consulta humedad mensual. (Fuente Weatherspark)..

La edificación se encentra ubicada, de acuerdo con la escala de Holdrigh, en la zona de vida bosque pluvial, altitud promedio según el IDEAM para Bogotá es de 2500 a 2800 msnm y de 2564 msnm según Topographic Maps, posee una temperatura promedio entre 7°C y 19°C.

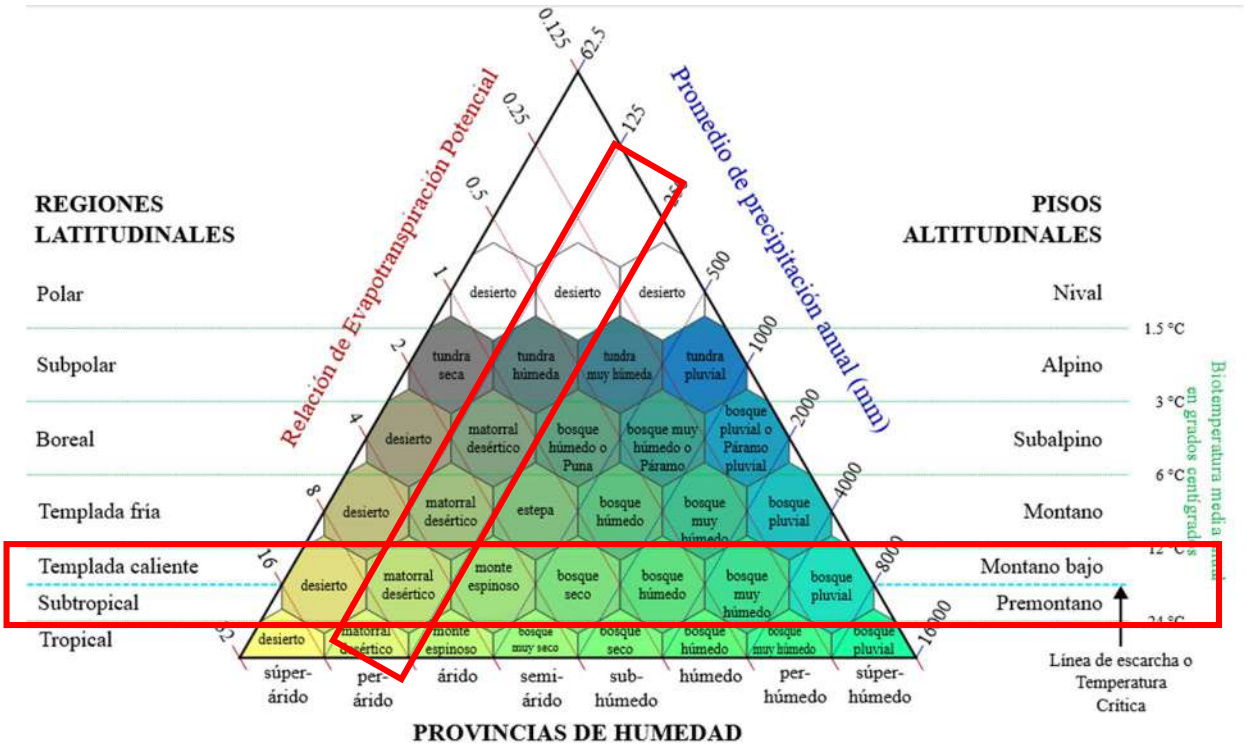

Ilustración 10. Diagrama bioclimático para la clasificación de zonas de vida en el mundo de (L. R. HOLDRIDGE)

6.3. VIENTO

La dirección principal de predominio del viento es Noreste con corrientes intensas en los meses de diciembre, enero, febrero y marzo pueden alcanzar intensidades de 1.5 a 2.5 m/s.

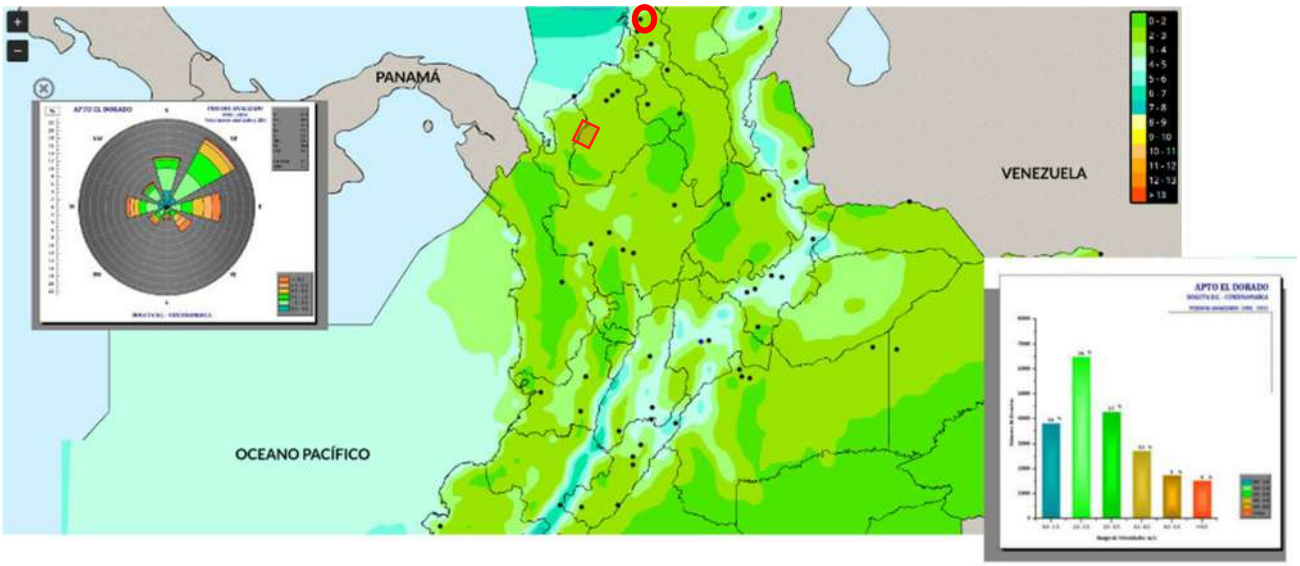

Ilustración 11. *(Fuente Instituto de Hidrología, Meteorología y estudios Ambientales – IDEAM).*

6.4. VEGETACIÓN.

No se evidencia presencia en el inmueble de vegetación denotada como agresiva en la NSR-10 en su título H.9.4.6. 2.a. control de especies agresivas, la cual, prevé las especies agresiva para las construcciones, especies invasoras que afectan el entorno de la edificación pues buscan el agua bajo la cubierta propicia de la edificación y en algunos casos invaden con sus raíces las tuberías de los alcantarillados, teniendo particularidades como especies originarias del exterior, de zonas con climas particularmente severos.

De la anterior información se puede observar que, al ser una zona con pendiente pronunciada, con precipitaciones en donde al tener zonas verdes como las que rodean las edificaciones son sectores potenciales de infiltración de aguas, además de movimientos indeseados de tierras.

7. CARACTERIZACIÓN DE LA ESTRUCTURA.

7.1. DISTRIBUCIÓN DE CERCHAS

Se identifican 5 tipos de cerchas didstintas distribuidas como se muestran a continuación.

Ilustración 18. Inspección estado actual elementos metalicos..

9. CALIFICACIÓN SEGÚN NSR-10.

CALIFICACIÓN CALIDAD DEL DISEÑO Y CONSTRUCCIÓN SEGÚN NSR-10 A.10.2.2.1
Calificación = BUENA.
Coeficiente de calidad de diseño = 1.0.
Calidad del diseño y la construcción de la estructura original: La cubierta se construyó con la tecnología y técnicas de su época cumpliendo con las normativas de construcción vigentes según los principios normativos de NSR-10.

CALIFICACIÓN ESTADO DE LA ESTRUCTURA EXISTENTE SEGÚN NSR-10 A.10.2.2.2 –
Clasificación = BUENA.
Coeficiente de estado de la edificación = 1.0..
Estado actual de la estructura: Actualmente la cubierta no presenta distorsiones fuera de la tolerancia, el estado de conservación y mantenimiento de la edificación ha sido permanente por lo tanto no hay procesos de deterioro en elementos y materialidades, no presenta lesiones que amenacen la seguridad y estabilidad.

10. CONCLUSIONES.

La cubierta no presenta alteraciones en su materialidad, al moemnto de la inspeccion se estaban realizando procesos de pintado de elementos metalicos con pintura anticorrosiva lo cual permite observar un estado de mantenimiento actualizado a fecha del presente informe.

12. MEMORIAL DE RESPONSABILIDAD.

Por medio de la presente informo que se realizó el estudio de patología de la edificación **ICA SEDE MAGANGUÉ**, ubicada **BOLIVAR.-COLOMBIA**.

El estudio de patología se realizó con los criterios del reglamento **NSR-10** y por tanto en calidad de diseñador asumo la responsabilidad derivada por dicho diseño exonerando a la autoridad competente y al profesional revisor de toda responsabilidad inherente al mismo dentro de lo concerniente al presente diseño estructural siempre y cuando se realice la obra con los parámetros aquí consignados.

Así mismo certifico que tengo la experiencia y los estudios de postgrado en estructuras como lo soporta el diploma de especialista anexo, por lo tanto, estoy facultado como diseñador de elementos estructurales y no estructurales, según lo estipulado en el **artículo 27** y **29** de la **Ley 400** de **1997**.

Cordialmente:

INTRODUCCIÓN

Estas memorias de cálculo corresponden el diseño estructural de la modificación de la cubierta para el ICA sede MAGANGUÉ, localizada en MAGANGUÉ departamento del Bolivar; el diseño se realiza contemplando condiciones locales como parámetros sísmicos y velocidad de viento predominante del sector.

La cubierta no pertenece al sistema de resistencia sísmica, el análisis y diseño estructural se diseñó de acuerdo con AIS 180-13 Recomendaciones para requisitos sísmicos de estructuras diferentes de edificaciones, capítulo A.8 de la NSR-10 y F2 de la NSR-10.

Para la realización de estas memorias de cálculo, se hizo el análisis estructural de elementos por medio de un programa de análisis estructural. Se realiza modelación matemática de la estructura, y el análisis sísmico con longitudes reales de los elementos y se incluyen los elementos de la estructura principal con las combinaciones de carga definidas por la Norma Sismo Resistente NSR- 10.

Para la obtención de las fuerzas sísmicas, bajo los lineamientos de NSR-10 reglamento de Construcción Sismorresistentes, siguiendo los parámetros sísmicos para la zona de respuesta sísmica, se procedió a un análisis dinámico.

CONSIDERACIONES GENERALES DE DISEÑO

LOCALIZACIÓN, NIVEL DE AMENAZA Y MOVIMIENTOS SÍSMICOS DE DISEÑO

El proyecto está ubicado en zona de amenaza sísmica **INTERMEDIA**, con un coeficiente de aceleración pico **Aa=0.10**, y de velocidad pico **Av=0.15** con un el coeficiente de importancia **I=1.00**.

Se incluyen en estas memorias: el análisis de cargas, los resultados del programa de análisis, el diseño de elementos estructurales:

Para el desarrollo del proyecto se debe tener en cuenta las especificaciones generales de diseño las cuales indican que la estructura debe tener resistencia y rigidez adecuada ante las cargas mínimas de diseño prescritas por el reglamento y debe, además, verificarse que dispone de rigidez adecuada para limitar la deformabilidad ante las cargas de servicio, de tal manera que no se vea afectado el funcionamiento de la edificación. Teniendo esto en cuenta, se evalúan todas las solicitaciones que pueden afectar la edificación de acuerdo con los requisitos de la norma, estas incluyen: el efecto gravitacional de la masa de los elementos estructurales, o peso propio, las cargas de acabados y elementos no estructurales, las cargas muertas, las fuerzas de viento, las deformaciones impuestas por efectos reológicos de los materiales estructurales.

En cuanto al análisis, las diferentes solicitaciones que deben ser tenidas en cuenta se combinan para obtener las fuerzas internas de diseño de la estructura, de acuerdo con los requisitos del Capítulo B.2 del Reglamento, las solicitaciones se multiplican por el coeficiente de carga prescrito para cada combinación. En los efectos causados por el sismo de diseño se tiene en cuenta la capacidad de disipación de energía en rango inelástico, del sistema estructural, y logra emplear unos efectos sísmicos reducidos de diseño E, obtenidos dividiendo las fuerzas sísmicas FS, por el coeficiente de capacidad de disipación de energía R (E =FS/R). El coeficiente de capacidad de disipación de energía, R.

MATERIALES

ACERO ESTRUCTURAL CORREAS (PERLIN)	ASTM A1011 Gr. 50 fy=350MPa, 3515 Kgf/cm2, 50KSI
ACERO ESTRUCTURAL PLATINAS	ASTM A-36 fy=250 MPa, 2515 Kgf/cm2, 36KSI.
ACERO ESTRUCTURAL	ASTM A-36 fy=250 MPa, 2515 Kgf/cm2, 36KSI.
SOLDADURAS	ELECTRODO E-60XX y E-70XX SEGÚN NORMA AWS D-1.1.
PERNOS	ASTM A-325 O EQUIVALENTES PARA CONEXIÓNES PERNADAS ENTRE ELEMENTOS.
	ASTM A-193 Grado B7 O EQUIVALENTES PARA CONEXIÓNES A CONCRETO.

CÓDIGOS QUE RIGEN EL DISEÑO

Para el análisis y diseño se utilizan las siguientes Normas

NSR-10	Reglamento de construcción sismo resistente colombiana decreto 945 de 2017.
ACI-IPS-1 (NSR-10. C1.1.8)	Requisitos esenciales para edificios de concreto reforzado.
ACI 318.	Requisitos de reglamento para concreto estructural.
AISC- AISI 2008.	Especificaciones para construcción en acero

NORMAS TECNICAS QUE RIGEN EL DISEÑO

Para el análisis y diseño se utilizan las siguientes Normas Técnicas Colombianas:

NTC 2289	NTC 321	NTC 2043
NTC 5806	NTC 1920	NTC 1985
NTC 174	NTC 4578	NTC 5832
NTC 4029	NTC 4035	

DESCRIPCIÓN DEL SISTEMA ESTRUCTURAL

La cubierta no pertenece al sistema de resistencia sísmica, el análisis y diseño estructural se diseñó de acuerdo con AIS 180-13 Recomendaciones para requisitos sísmicos de estructuras diferentes de edificaciones, capítulo A.8 de la NSR-10 y F2 de la NSR-10. Tiene un nivel que soporta una cubierta metalica.

COMBINACIONES DE CARGA

3. COMBINACIONES DE CARGAS MAYORADAS USANDO EL METODO DE RESISTENCIA PARA VERIFICAR DERIVAS (B.2.4 de NSR10)

Nomenclatura (NSR10 B.2.2):

D: Carga Muerta consistente en: a) Peso propio del elemento, b) peso de todos los materiales de construcción incorporados a la edificación y que son permanentemente soportados por el elemento incluyendo muros y particiones divisorias de espacios y c) peso del equipo permanente.

L: Cargas vivas debidas al uso y ocupación de la edificación, incluyendo cargas debidas a objetos móviles, particiones que se pueden cambiar de sitio. Incluye cualquier reducción que se permita. Si se toma en cuenta la resistencia a cargas de impacto este efecto debe tenerse en cuenta en la carga viva L.

Lr: Carga viva sobre la cubierta.

G: Carga debida al granizo, sin tener en cuenta la contribución del empozamiento.

Le: Carga de empozamiento de agua.

EX: Fuerzas sísmicas reducidas de diseño en dirección X-X (E=FS/R) que se emplean para diseñar los miembros estructurales.

EY: Fuerzas sísmicas reducidas de diseño en dirección Y-Y (E=FS/R) que se emplean para diseñar los miembros estructurales.

FSX: Fuerzas sísmicas sin reducir en dirección X-X calculadas de acuerdo con los requisitos del Titula A de NSR10.

FSY: Fuerzas sísmicas sin reducir en dirección Y-Y calculadas de acuerdo con los requisitos del Titula A de NSR10.

3. COMBINACIONES DE CARGAS MAYORADAS USANDO EL METODO DE RESISTENCIA PARA EL DISEÑO DE LA SUPERESTRUCTURA (B.2.4 de NSR10)

ESPECTRO PARA DISEÑO

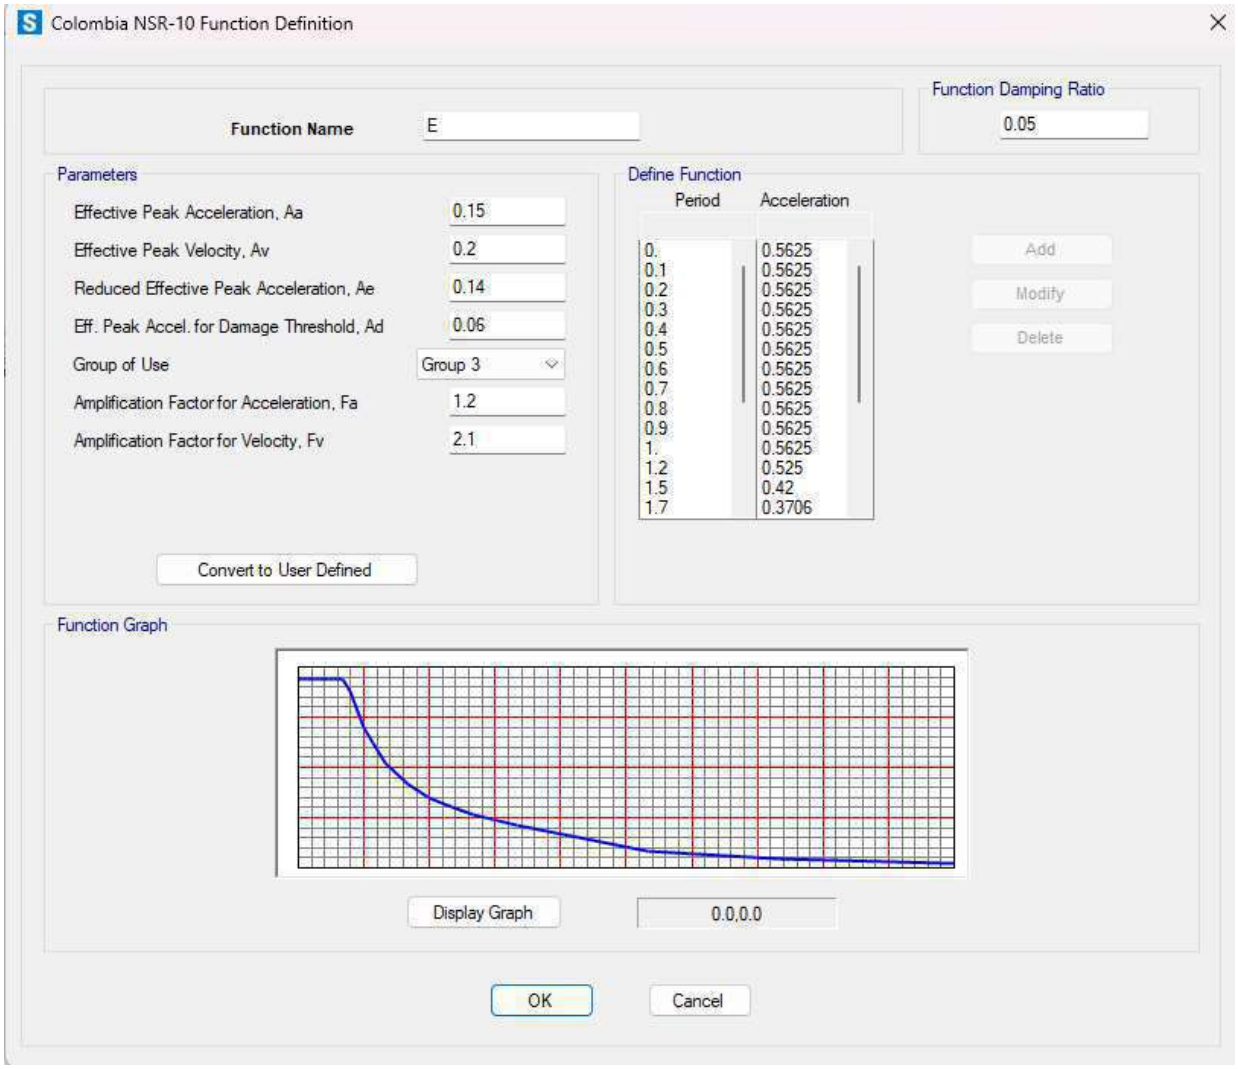

Ilustración 10. Espectro para diseño según NSR-10.

El resumen de los coeficientes de reducción de capacidad de disipación es: 1.00

RESULTADOS DEL ANALISIS

Para el análisis estructural se utilizó un software, el cual trabaja con métodos numéricos y matriciales siguiendo los principios de la mecánica, mediante el cual se obtiene el análisis para el diseño de los elementos. A continuación, se presentan las fuerzas internas de cada elemento para su diseño.

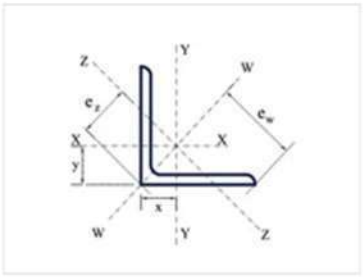
VERIFICACION DE ELEMENTOS DE CUBIERTA

Los elementos fueron verificados mediante el empleo de hojas de cálculo a partir de los efectos obtenidos en la envolvente de diseño programada en el modelo estructural.



VERIFICACION DE ELEMENTOS EXISTENTES DE CUBIERTA CERCHA TIPO 1

La verificación a tensión, compresión, flexión y flexo-compresión de los elementos aéreos se realiza para soportar los efectos obtenidos de la envolvente. Bajo las combinaciones de carga con el método de esfuerzos de trabajo para los elementos de madera y las combinaciones de carga mayoradas usando el método de resistencia.

$$4.71\sqrt{\frac{E}{F_y}} = 112.59$$

Esf. de pandeo por flexión en X $F_{cr,x}$= 214.39 MPa
Esf. de pandeo por flexión en Y $F_{cr,y}$= 214.39 MPa

PANDEO POR TORSIÓN

Esf. de pandeo elástico por torsión $F_{e,z}$= 2239.16 MPa
Esf. de pandeo por torsión $F_{cr,z}$= 327.83 MPa

CAPACIDAD DEL PERFIL

Esfuerzo critico a compresión F_e= 214.39 MPa

ϕP_n= 29.33 KN > 28.14 KN **O.K.**

CONCLUSIONES

- La estructura fue analizada y verificada de acuerdo con la normatividad vigente NSR-10 y las condiciones actuales no presentan deterioro.

- Del análisis numérico se deduce que la estructura es apta para ser reutilizada

- Teniendo en cuenta los resultados de los índices de flexibilidad y resistencia obtenidos en todos los elementos que conforman la estructura, se garantiza el cumplimiento de la NSR-10.
