CONTROL DE EJECUCION DE DISEÑO 92

INTRODUCCIÓN

La relevancia de una topografía es poder tener el insumo necesario para un diseño, además que permite poder hacerles seguimiento y control a las diferentes etapas del mismo, las actividades desarrolladas se dan en la zona rural del municipio de la Jagua de Ibirico aproximadamente a 13 kilómetro del corregimiento de la victoria de san isidro donde se localiza el inicio de vía veredas Argentina norte y Argentina Sur.

Para dar inicio estas actividades se amojonaron en puntos estratégicos los cuales fueron georreferenciados, así se inició en descendentes desde el kilómetro 11+000 punto conocido como el espejo hacia el kilómetro 0+000. El sistema de medición se realizó con poligonal abierta detallando cada elemento encontrado a lo largo de la medida hasta llegar a la placa huella existente en kilómetro 0+420 de igual manera se midió hasta el kilómetro 0+000 para así poder abscisar preciso el final y así poder localizar el sector a intervenir por parte del proyecto.

FOTO 3 Y 4 LOCALIZACIO GPS_4.

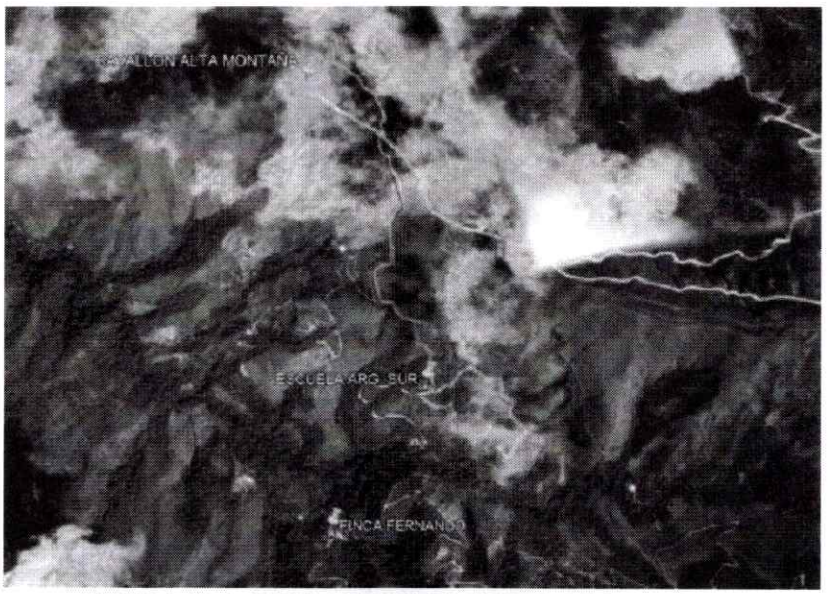

FIGURA N° 1 GEOPOSICIONAMIENTO GPS 3 Y GPS 4.

El desarrollo de las actividades para este levantamiento topográfico tomo como referencia el vértice mojón IGAC-20400003 y 20400004 ubicado en el corregimiento de la victoria de san isidro, barrio los fundadores Municipio de la Jagua de Ibirico. Ver anexo 1.

FIGURA N° 2 Localización de puntos igag

FIGURA N° 3 Esquema de localización inicio y general del Tramo del proyecto Base Google Earth.

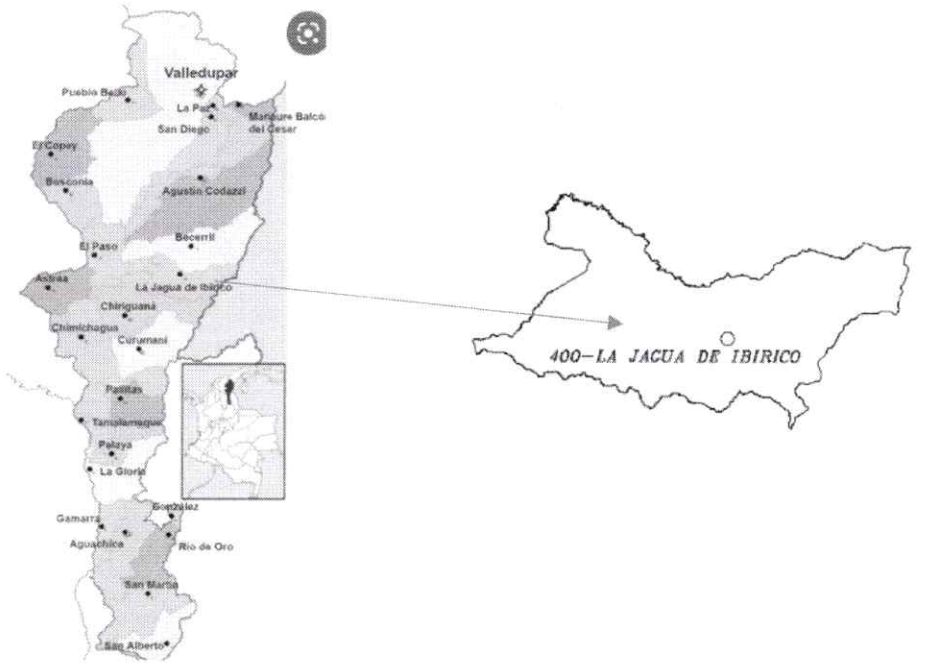

FIGURA N° 4 Y 5. Levantamiento Topográfico localización

El Municipio de la Jagua de Ibirico se encuentra en el centro del Departamento del Cesar, con tres corregimientos en siendo su principal por despensa y producción la victoria de san isidro siendo una de sus actividades agrícolas, tal como el plátano, el café, el maíz, entre otros.

La vía a intervenir se encuentra en la zona rural siendo un corredor de gran importancia para la movilización los productos dinamizantes de su economía como es el café.

OBJETIVOS

OBJETIVOS GENÉRALES

Proporcionar la información necesaria para el procesamiento digital y obtener un modelo acorde a los accidentes topográfico en campo.

OBJETIVOS ESPECÍFICOS.

Entre los objetivos específicos que se persiguen con la realización de este estudio se encuentran:

./ Realizar el levantamiento plani-altimétrico en la zona de influencia del proyecto, con el fin de obtener la información de todos los elementos existentes, su ubicación y características, los cuales se verán afectados con la construcción y adecuación del área de estudio.

./ Poder tener un modelo acorde para el seguimiento ejecutorio de las diferentes actividades..

./ Sistematizar la cartografía de la zona de influencia directa del proyecto en estudio, utilizando medios computacionales, a fin de servir de base en los estudios de consultoría de las obras de adecuación.

PLANIMETRIA

DESCRIPCION DE LOS TRABAJOS

COMOSIÓN DE TOPOGRÁFIA Y RESUMEN LEVANTAMIENTO.

Topógrafo: Alexander Manjarrez Campo Lic.01-11593 C.PN.T. (Ver anexo)

Auxiliar1: Elver Quintero.

Auxiliar 2: Nelson Quintero.

Auxiliar oficina: Javier Ricardo Sánchez.

METODOLOGIA

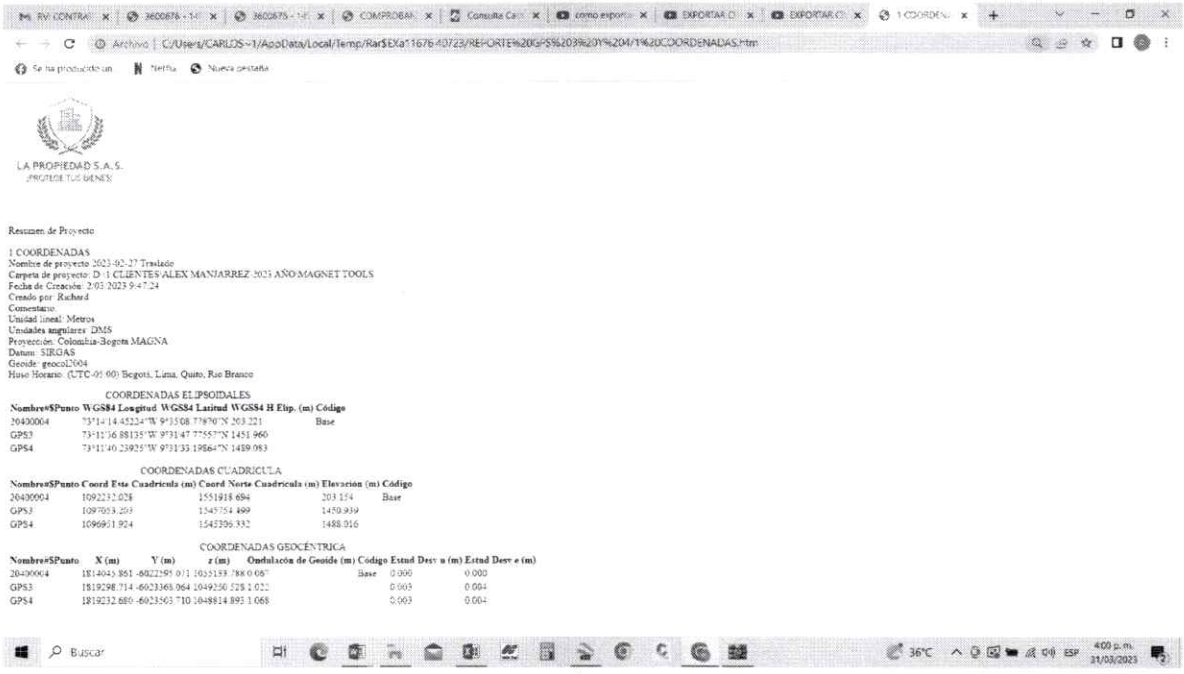

POSICIONAMIENTO

- Georreferenciación Del Área para el desarrollo de proyecto mediante poligonal dejando punto para amarres en cada uno de los sitios. A continuación, se relacionan los resultados obtenidos anexos al presente informe.

LEVANTAMIENTO TOPOGRÁFICO

Se realizó el levantamiento topográfico, amarrando el proyecto al punto posicionado por INSTITUTO GEOGRAFICO AGUSTIN CODAZZI llamado 20400004, en el corregimiento de la Victoria de San Isidro desde donde se da geo posicionamiento a unos mojones localizados uno en la escuela Zumbador y el otro en el km 9+880 lado derecho.

Puntos producto de la poligonal. A continuación, se describe los atributos de los puntos.

Posteriormente una poligonal detallando cada elemento encontrado en sito por medio de radiación y con puntos de apoyo para lograr los detalles a lo largo de los sectores a intervenir esta toma de detalles se realizó una estación total GTS-235W TOPCON. (anexos certificados de calibración).

Mediante el desarrollo de los estudios topográficos, se obtuvo la información detallada de todas las componentes e infraestructura del área de influencia del proyecto; así también de los elementos ubicados en la zona. En términos generales, este estudio proporcionó la información de las características topográficas actuales del área de influencia directa del proyecto.

Así mismo las diferentes limitaciones, como los cercados delimitadores de la propiedad privada, determinando los limites laterales de los sectores.

CARTERA DE DETALLES

Ver anexo.

PRECISIÓN EN LA MECIÓN Y LA POSICIÓN

Las mediciones de la posición y de la altura dependen de factores como: tiempo de la medición temperatura, Dentro de esta actividad, se plantearon y discutieron las diferentes alternativas que se pueden presentar para la elaboración de los estudios, se determinaron los frentes de trabajo, se dictaron prioridades en la sectorización de acuerdo a sus características y por último se definió el nivel de precisión al que se llegó con cada actividad involucrada en el estudio. Las actividades principales para la calidad y precisión en el trabajo de campo o recolección de datos de campo, se listan a continuación:

1. Creación de poligonales de apoyo (puntos con coordenadas y cotas).
2. Levantamiento de todos los detalles topográficos en coordenadas y cotas.

    i) Levantamiento Planimétricos -Altimétrico de alta precisión.

ii) Equipo utilizado: estación Total Digital de alta precisión TOPCON GTS 235W, con colector interno de datos. O Parámetros de precisión:

iii) Angular= Lectura mín. 1"

iv) Localización de elementos constructivos existentes.

v) Método utilizado, poligonal de apoyo. Long. = 1 mm por Kilómetro doble lectura.

vi) El colector interno minimiza la posibilidad de cometer errores de transcripción o Manipulación de datos ya que estos se exportan directamente de la estación al software De cálculo (PC) y dibujo.

vii) Cierre Longitudinal permisible: Superior a 1 :5000

viii) Cierre angular permisible: = axn = 6"

REGISTRO DE DATOS

- **Procesamiento de la información de campo.**

Las principales actividades de procesamiento de la información de campo, hacen referencia a la Revisión, Organización y archivo; estas son listadas a continuación:

i) Creación de datos en los colectores electrónicos de información.
ii) Revisión y ajuste de los registros electrónicos de campo.
iii) Transferencia de los datos al software especializado en topografía.
iv) Archivo de la información.
v) Elaboración de la planta general de la zona de estudio.

- **Procesamiento en oficina**

Con los puntos procesados se envían los datos a oficina para completar el proceso de dibujo sea crean los planos planta, perfil y secciones de las cuales se aplica

las características de la presentación de planos a partir de convenciones, colores, tamaños de letra, escudos, numeración, entre otros, ejemplos de ello son:

PROCESAMIENTOS DE DATOS CRUDOS CON TOPCONLINK

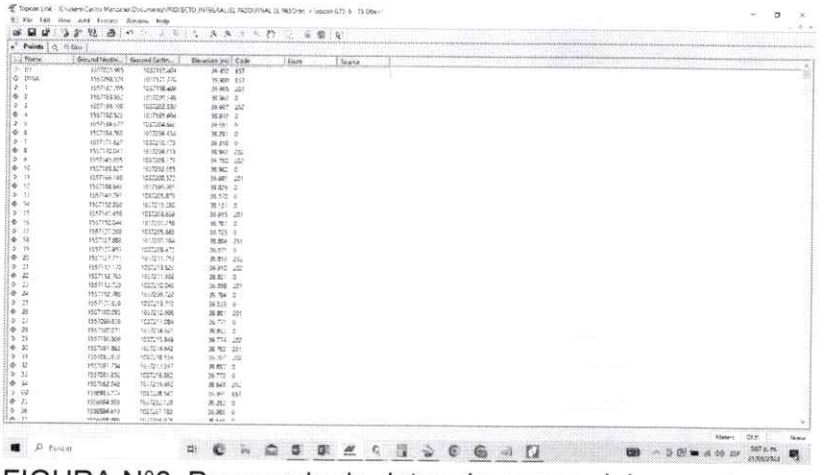

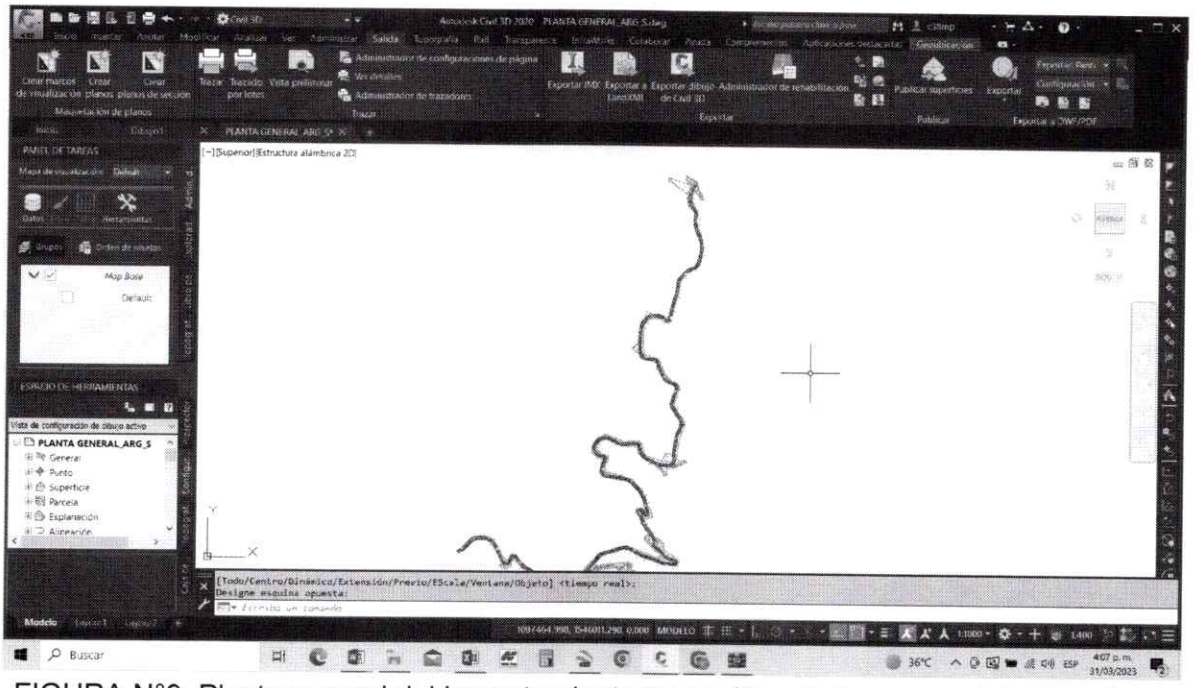

FIGURA N°8. Procesado de datos de campo del proyecto.

Líneas de paramentos, cercos, ubicación de deltas, postes, zonas verdes, arboles, entre otros que marcan la vía existente y dan una imagen aproximada a la realidad que se encuentra en el área del levantamiento topográfico.

. FIGURA N°9. Planta general del Levantamiento topográfico de las zonas del proyecto KM 0+00 AL KM 2 SECTOR_PRINCIPAL.

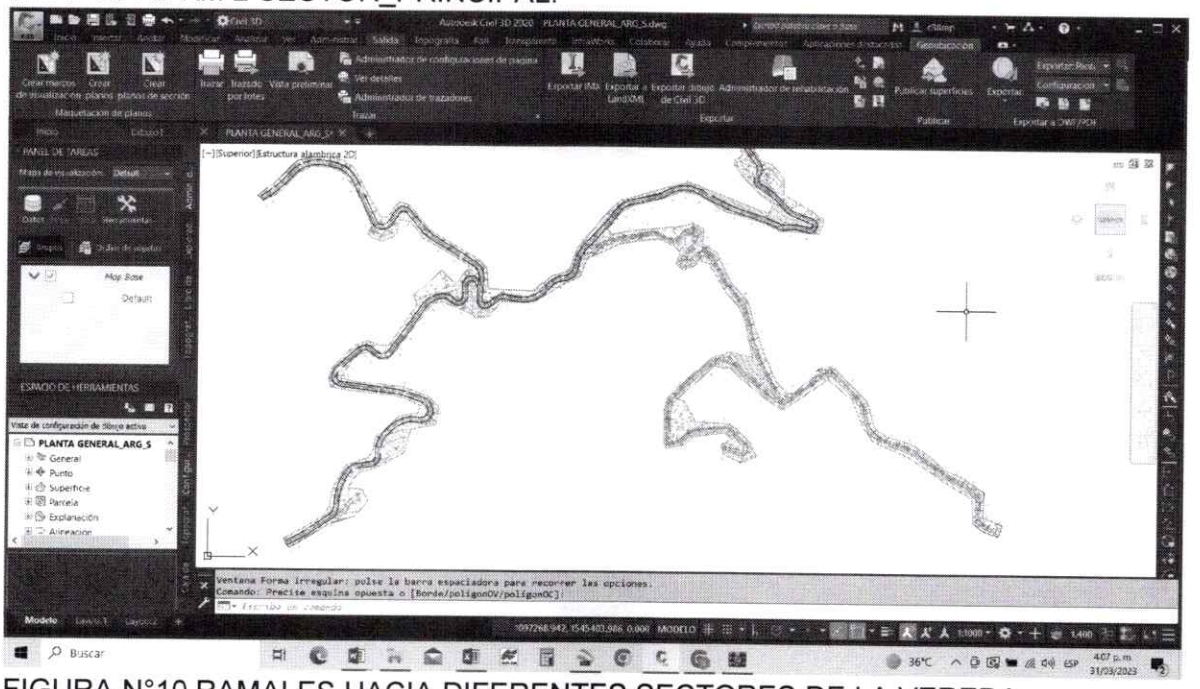

FIGURA N°10 RAMALES HACIA DIFERENTES SECTORES DE LA VEREDA.

Este proceso se realiza con la ayuda del programa AutoCAD CIVIL 2019, como primer paso se insertan los puntos obtenidos de los datos anteriormente descritos.

Software

AUTOCAD CIVIL 3D 2014/ DIBUJO EXCEL /CALCULO.

EQUIPO Y PERSONAL

Para la ejecución de los trabajos topográficos en el proyecto se organizó una comisión de topografía, compuesta por un topógrafo, dos cadeneros y un auxiliar de oficina, dotados de un equipo, una estación total.

CONTROL DE EJECUCION DE DISEÑO

El control topográfico es una actividad esencial para garantizar que un proyecto vial rural se ejecute de acuerdo con los diseños establecidos por el ingeniero civil, asegurando su correcta implementación en el terreno. En este proceso, la mano de obra de la comisión topográfica se limitó exclusivamente al levantamiento de control y validación, sin realizar actividades de excavación o replanteo nuevo.

Control de Cotas

El control de cotas se centra en validar las elevaciones propuestas en el diseño en relación con la topografía existente, utilizando nivelación geométrica y estacionamientos de control para confirmar las diferencias de altura establecidas en los planos. Esto permitió verificar que las cotas de rasante, subrasante y otros elementos del perfil longitudinal correspondieran con el diseño, apoyándose en una red de puntos de control georreferenciados. Mediante el uso de equipos como nivel óptico y estación total, se corroboraron las cotas en cada etapa del proyecto. Este trabajo contribuyó a garantizar que las pendientes y secciones propuestas en el diseño se plasmaran correctamente en el terreno, sin intervenir directamente en actividades de ajuste físico o excavación.

Control de Abscisas

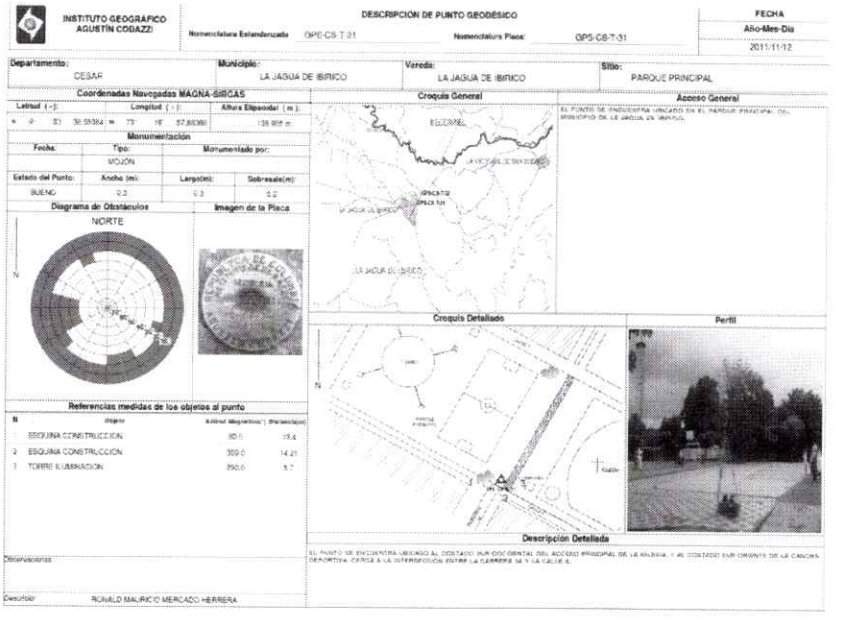

El control de abscisas se enfocó en verificar la correcta ubicación horizontal de la vía, asegurando que los ejes definidos en el diseño geométrico vial fueron trasladados adecuadamente al terreno. A partir de las coordenadas UTM del proyecto, se validó que el alineamiento horizontal, incluyendo curvas, intersecciones y elementos adicionales, se ajustará a las directrices de diseño sin necesidad de replanteos nuevos. Este proceso incluyó la verificación de radios, desarrollos y longitudes de tangentes, y se mantuvo un control periódico para asegurar que el diseño geométrico permaneciera conforme en todas las fases de la obra.

Validación y Verificación de Datos

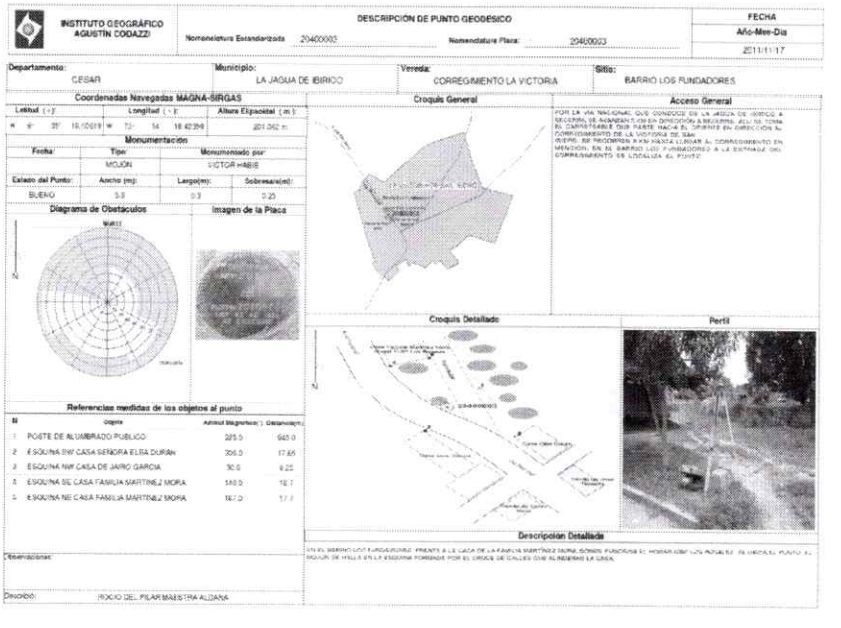

La comisión topográfica se enfocó exclusivamente en la verificación técnica de los datos de campo frente a los valores de diseño. A través de herramientas de procesamiento topográfico, se validó que los puntos de control, tanto de cotas como de abscisas, reflejaran con precisión lo proyectado en los planos, minimizando cualquier posible desviación. Este enfoque permitió garantizar que los alineamientos y niveles definidos en el diseño se plasmaran de manera precisa en la obra, sin ejecutar ajustes físicos en el terreno y asegurando la fidelidad con las especificaciones técnicas del proyecto.

CUIDADOS A TENER CON SU EQUIPO TOPOGRAFICO

1. Transportar su equipo siempre en su maleta, nunca montado en el trípode.

2. Cuando valla a nivelar el equipo, nivele el nivel circular primero con el trípode; después afine con los tornillos de nivelación.

3. No permita que nadie utilice la maleta del equipo como silla, no se siente sobre ella.

4. No apretar demasiado el tornillo del trípode que sujeta al equipo, puede dañar la rosca de la base del equipo.

5. No apretar demasiado los tornillos del trípode, simplemente dele el ajuste necesario.

6. No permita que personas no calificadas ajenas al topógrafo se acerquen y manipulen los equipos.

7. Recuerde que del buen estado del equipo también depende un buen resultado del trabajo.

Anexo N° 3. Tarjeta profesional topógrafo.

Anexo N° 4. Cedula de Ciudadanía

OBSERVACIONES:

- El levantamiento topográfico se realizó en el área de proyecto: VIA TERCIARIA EN LA VEREDA ARGENTINA SUR, CORREGIMIENTO DE LA VICTORIA DE SAN ISIDRO, MUNICIPIO DE LA JAGUA DE IBIRICO, CESAR.
- Se realizó la implantación del Abscisado y cotas del diseño geométrico del proyecto en los tramos intervenidos (Curvas y sobreanchos).
- Se llevó a cabo el control eficiente de cotas y abscisas para asegura la correcta implantación del diseño, reduciendo al mínimo los errores y garantizando que la obra final cumpla con los parámetros geométricos y funcionales establecidos en el proyecto (verificación de altura de las placas).
- En el presente periodo se llevó a cabo verificación los volúmenes de corte y relleno generados, las cuales se observan en el cuadro de volúmenes.
