

ACH: Colorado Official

These results suggest that the presence of a social network is associated with a higher probability of being employed, and that the size of the network is positively related to the probability of being employed. This finding is consistent with the theory that social networks provide information and resources that can be used to find employment. The results also suggest that the quality of the network is important, as individuals with a higher proportion of high-quality contacts are more likely to be employed. These findings have important implications for policy and practice, as they suggest that efforts to improve employment outcomes should focus on supporting individuals to build and maintain strong social networks.
