Subject: Technical clarifications on LED lights/flasher system

Dear gentlemen

Regarding clarifying the provision of the led lights systems, please find below the main considerations for proper installation and fully functional accomplishment of the system:

1. The lights systems are installed when the flight chamber area is free of contamination of civil works, like dust, concrete, sand or any other element that may interfere with the proper fixing of the stripes in the crystal.
2. The lights are synchronized to the camera system for photo and video recording, but as now this are out of execution of the project, the lights will be installed, but none in the fully functional purpose of having the tunnel ready for competitions or professional training mode.
3. The lights are installed under technical parameters that allow suitable illumination on the flying zone, marking areas of maneuver during the skydiving practice, then the lights and camera systems are fundamentals for the best exploitation of the tunnel.
4. The lights can be installed by Strojirna Litvinov personnel or by Colombian technical personnel that previously has received instruction on how to make a correct installation.

Based on the above, Strojirna Litvinov continues supporting the efforts to finalize this stage of civil works and proceed with the starting of the tunnel and skydiving instructions promptly.

Sincerely

Ing. Jan Spatka PhD
Wind tunnel division Director
